In the Claims:

From-BURR AN

Please rewrite claim 4 as fullows:

 (Original) A ccramic envelope for high intensity discharge lamp made of a light transmission ceramics, comprising:

a cylindrical barrel section forming an electric discharge light emitting space;
an annular closing section that closes both ends of the barrel section, respectively;
a capillary section for inserting and fixing an electric discharge electrode to be
outwardly protruded so as to be opposed to each other from a substantial center position of
both closing sections,

wherein the barrel section thickness of at least one of the boundary sections between both of the barrel section and closing section is continuously increased at a ratio from 1.2 to 2.0 relevant to the thickness in the vicinity of the center of the electrical discharge light emitting space.

 (Original) A ceramic envelope for high intensity discharge lamp made of a light transmission ceramics, comprising:

a cylindrical barrel section forming an electric discharge light emitting space;
an annular closing section that closes both ends of the barrel section, respectively:
a capillary section for inserting and fixing an electric discharge electrode to be
outwardly protruded so as to be opposed to each other from a substantial center position of
both closing sections,

wherein a ratio of an inner diameter in the vicinity of an end of said barrel section to an inner diameter of the center of the barrel section is equal to or greater than 0.8 and is less than 1.

 (Original) A ceramic envelope for high intensity discharge lamp made of a light transmission ceramics, comprising:

a cylindrical barrel section forming an electric discharge light emitting space;
an annular closing section that closes both ends of the barrel section, respectively;
a capillary section for inserting and fixing an electric discharge electrode to be
outwardly protruded so as to be opposed to each other from a substantial center position of
both closing sections,

wherein a surface roughness Ra of the interior surface of said barrel section is 0.01 μm to 0.4 μm , and the additive concentration in the vicinity of the interior surface of said barrel section is % or less of that in the vicinity of the center of the thickness.

4. (Currently Amended) A ceramic envelope for high intensity discharge lamp made of a light transmission ceramics, comprising:

a cylindrical barrel section forming an electric discharge light emitting space;
an annular closing section that closes both ends of the barrel section, respectively;
a capillary section for inserting and fixing an electric discharge electrode to be
outwardly protruded so as to be opposed to each other from a substantial center position of
both closing sections,

wherein the barrel section thickness of at least one of the boundary sections between both of the barrel section and closing section is continuously increased at a ratio from 1.2 to 2.0 relevant to the thickness in the vicinity of the center of an electric discharge light emitting space, and a ratio ifof a diameter in the vicinity of an end of the barrel section to a diameter of the center of the barrel section is equal to or greater than 0.8, and is less than 1.0.

The second of th

5. (Previously Amended) A ceramic envelope for high intensity discharge lamp as claimed in claim 1, wherein the surface roughness Ra of the interior surface of the barrel section is from 0.01 μm to 0.4 μm, and the additive concentration of the surface of said barrel section is ½ or less of that in the vicinity of the center of the thickness.

C) C)

- 6. (Previously Amended) A ceramic envelope for high intensity discharge lamp as claimed in claim 3, wherein an additive consists of at least one or more kinds of Sc₂O₃, MgO, ZrO₂, Y₂O₃, and lanthanoid based rare earth uxide.
- 7. (Previously Added) A ceramic envelope for high intensity discharge lump as claimed in claim 2, wherein the surface roughness Ra of the interior surface of the barrel section is from 0.01 μm to 0.4 μm, and the additive concentration of the surface of said harrel section is ½ or less of that in the vicinity of the center of the thickness.
- 8 (Previously Added) A ceramic envelope for high intensity discharge lamp as claimed in claim 4, wherein the surface roughness Ra of the interior surface of the barrel section is from 0.01 μm to 0.4 μm, and the additive concentration of the surface of said barrel section is ½ or less of that in the vicinity of the center of the thickness.
- 9 (Previously Added) A ceramic envelope for high intensity discharge lamp as claimed in claim 5, wherein an additive consists of at least one or more kinds of Sc₂O₃, MgO, ZrO₂, Y₂O₃ and lanthanoid based rare earth oxide.

From-BURR AN

10 (Previously Added) A ceramic envelope for high intensity discharge lamp as claimed in claim 7, wherein an additive consists of at least one or more kinds of Sc₂O₃, MgO, 7πO₂, Y₂O₃ and lanthanoid based rare earth oxide.

col.

11. (Previously Added) A ceramic envelope for high intensity discharge lamp as claimed in claim 8, wherein an additive consists of at least one or more kinds of Sc₂O₃, MgO, ZrO₂, Y₂O₃ and lanthanoid based rare earth oxide.
